NET SCORE +0 / ±6 → NEUTRAL / SELECTIVE — pick spots

in this band 5 sessions · signals flip on published thresholds only — see method line on each row

WHAT THE TAPE FAVORS TODAY

- Trend broken (below 200d, momo negative) → cut beta, favour FMCG / pharma / cash until the 200d reclaims.
- Brent up +12.2% in 21d → import-bill headwind: trim OMCs/paints, watch INR and CPI pass-through.
- INR steady/firm (94.94, 21d -0.5%) → FII-sensitive names breathe; rate-sensitives work.
- Vol compressed and decaying → carry-friendly tape; hedges are cheap — keep a small tail hedge on.

Rules, not opinions: every bullet above is generated by a threshold on the numbers shown. The terminal's HMM/Goldilocks engine remains the structural view; this page is the price-implied cross-check.

WHAT'S STRETCHED · WHAT CHANGED

- No extremes, flips or staleness flags today · a quiet tape is information too.

India daily G-sec curve has no free feed (FBIL/CCIL licensed) — levels above are RBI/FBIL anchors carried by the terminal's auto-scrape; direction is tracked daily via gilt-ETF prices. US complex is full daily history from FRED. MIBOR is unsecured (call money) vs the secured repo — its spread to repo is itself a liquidity signal, unlike SOFR–EFFR.

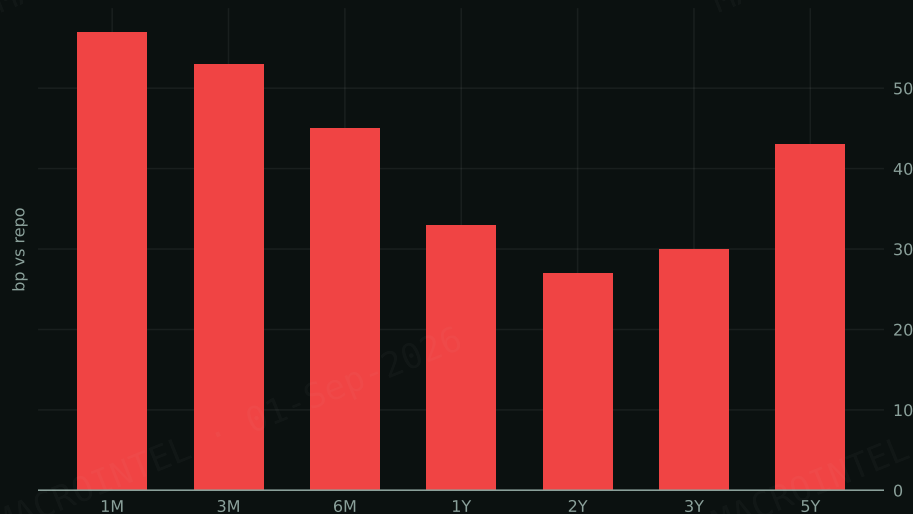

RBI Policy Corridor · where overnight money sits

MIBOR-OIS Curve · the priced RBI path

Policy Priced In by Tenor · OIS minus Repo (bp)

Front-End Read · rules on the anchors

MIBOR-Repo: -35bp → SURPLUS – call money drifting toward SDF

(unsecured vs secured – sign flips vs SOFR-EFFR)

1Y OIS – Repo: +33bp → ≈1.3 hikes priced over 1y

OIS 1s5s: +10bp → easing cycle then normalization priced

Levels are RBI/FBIL anchors via the terminal

(or ois_manual.json). Liquid tenors: 1Y & 5Y.

OIS beyond 5Y is thin – G-sec is the long-end read.

CURVE REGIME MATRIX · NOMINAL / INFLATION / REAL · US DAILY, INDIA VIA HONEST PROXIES

layer	pair	lvl bp	20d Δbp	regime	strength	note
IN · Nominal	5Y vs LT (ETF)	·	+0	Bear Steepener · d1	1/10	PROXY – gilt-ETF prices
IN · Policy path	OIS 1s5s	+10	·	easing-normalize	·	anchor – no daily history

Bull/Bear = direction of yields · Steepener/Flattener = direction of the spread · strength = |z| of the 20d spread move vs its own 3y distribution, capped at 10 · dN = days in state

Reading the three layers (US, daily):

- Nominal moves = growth + inflation + term premium, undifferentiated.
- Breakeven layer isolates the inflation-expectations component.
- Real (TIPS) layer is the growth/policy-stance residual – the one equities actually discount.

India, without self-deception:

- No INR inflation swaps trade; the 2013 linkers were bought back in Feb-2016 – so no daily inflation or real curve exists. Nominal direction comes from gilt-ETF prices (5Y vs long-duration, classified from price-implied yield moves). The forward-looking policy row is the MIBOR-OIS curve (anchors); the real row is 10Y minus trailing CPI. Blue rows = proxy/anchor.
- When a row is a proxy, treat the REGIME as informative and the strength score as absent – we do not synthesize confidence we don't have.
