## SIX MECHANICAL SIGNALS · EACH +1 / 0 / −1 · COMPUTED FROM PRICES, NO EDITORIAL INPUT

| signal | measured by | state | d | favors when + | favors when − |
|---|---|---|---|---|---|
| Nifty trend | px vs 50/200d SMA + momo z | −1 ▼ | d39 | cyclical beta, momentum longs | capital preservation, hedges |
| Equity vol | India VIX 2y %ile + RV impulse | −1 ▼ | d2 | carry, high-beta, option selling | defensives, long gamma |
| INR stability | USD/INR 21d change | +1 ▲ | d7 | FII-flow names, rate-sensitives | exporters/IT as INR hedge |
| Oil (import lens) | Brent 21d change | −1 ▼ | d3 | OMCs, paints, aviation, CPI relief | upstream oil, avoid importers |
| India yields (proxy) | Gilt LT ETF 21d px | −1 ▼ | d14 | banks, NBFCs, realty, autos | duration-heavy, leveraged names |
| Global risk | S&P momo z + MOVE %ile | 0 → | d4 | IT / export cyclicals | low-beta, domestic defensives |

**NET SCORE -3 / ±6 → DEFENSIVE — protect capital**

in this band 3 sessions · signals flip on published thresholds only — see method line on each row

### WHAT THE TAPE FAVORS TODAY

- Trend broken (below 200d, momo negative) → cut beta, favour FMCG / pharma / cash until the 200d reclaims.
- Brent up +8.2% in 21d → import-bill headwind: trim OMCs/paints, watch INR and CPI pass-through.
- INR steady/firm (94.67, 21d -1.1%) → FII-sensitive names breathe; rate-sensitives work.
- Gilt prices falling (yields up) → underweight leveraged balance sheets; margin pressure for NBFCs.
- Vol stressed → respect it: smaller size, defined-risk structures over naked longs.

Rules, not opinions: every bullet above is generated by a threshold on the numbers shown. The terminal's HMM/Goldilocks engine remains the structural view; this page is the price-implied cross-check.

## WHAT'S STRETCHED · WHAT CHANGED

- No extremes, flips or staleness flags today · a quiet tape is information too.

India daily G-sec curve has no free feed (FBIL/CCIL licensed) — levels above are RBI/FBIL anchors carried by the terminal's auto-scrape; direction is tracked daily via gilt-ETF prices. US complex is full daily history from FRED. MIBOR is unsecured (call money) vs the secured repo — its spread to repo is itself a liquidity signal, unlike SOFR−EFFR.

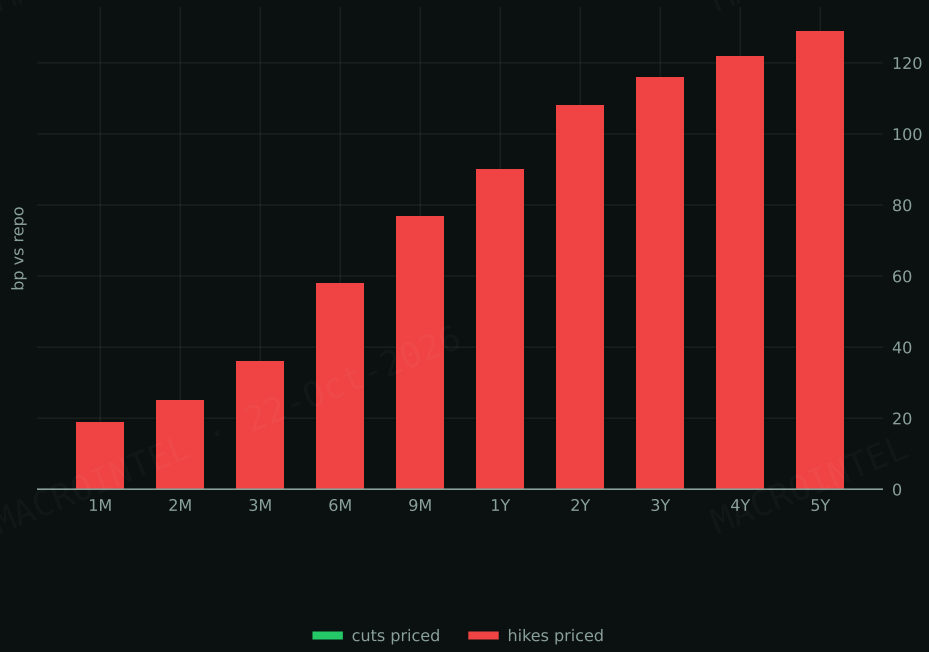

## RBI Policy Corridor · where overnight money sits

## MIBOR-OIS Curve · the priced RBI path

## Policy Priced In by Tenor · OIS minus Repo (bp)

## Front-End Read · rules on the anchors

MIBOR–Repo: +15bp → DEFICIT — call money pushed toward MSF

(unsecured vs secured — sign flips vs SOFR–EFFR)

1Y OIS − Repo: +90bp → ≈3.6 hikes priced over 1y

OIS 1s5s: +39bp → easing cycle then normalization priced

Levels are RBI/FBIL anchors via the terminal

(or ois_manual.json). Liquid tenors: 1Y & 5Y.

OIS beyond 5Y is thin — G-sec is the long-end read.

## CURVE REGIME · NOMINAL 2S10S ONLY · US DAILY, INDIA FROM THE RBI-HOME DATED STOCK

| layer | pair | lvl bp | 20d Δbp | regime | strength | note |
|---|---|---|---|---|---|---|
| IN · Nominal | 5Y vs LT (ETF) | · | +1 | Bear Steepener · d10 | 5/10 | PROXY — gilt-ETF prices |

Bull/Bear = direction of yields · Steepener/Flattener = direction of the spread · strength = |z| of the 20d spread move vs its own 3y distribution, capped at 10 · dN = days in state

Reading the three layers (US, daily):

Nominal moves = growth + inflation + term premium, undifferentiated.

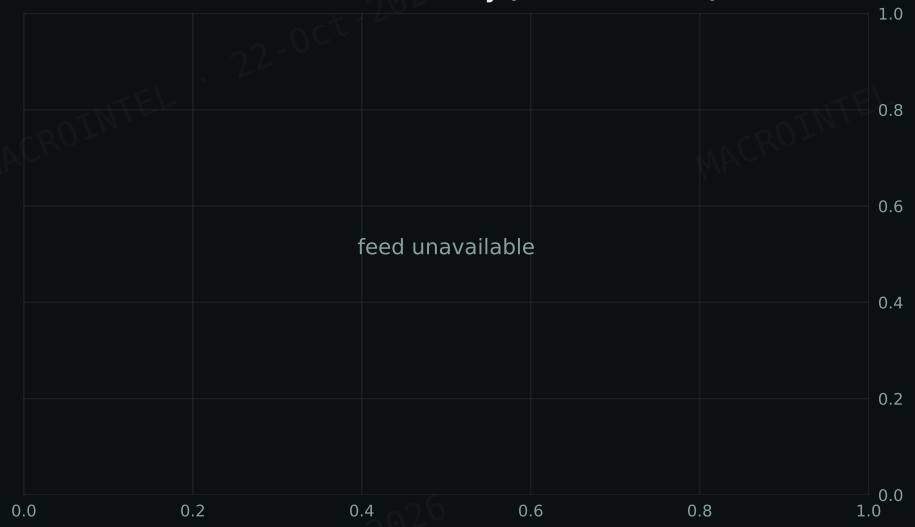

Breakeven layer isolates the inflation-expectations component.

Real (TIPS) layer is the growth/policy-stance residual — the one equities actually discount.

India, without self-deception:

No INR inflation swaps trade; the 2013 linkers were bought back in Feb-2016 — so no daily inflation or real curve exists. Nominal direction comes from gilt-ETF prices (5Y vs long-duration, classified from price-implied yield moves). The forward-looking policy row is the MIBOR-OIS curve (anchors); the real row is 10Y minus trailing CPI. Blue rows = proxy/anchor. When a row is a proxy, treat the REGIME as informative and the strength score as absent — we do not synthesize confidence we don't have.
